(8 Bit ASCII graphics use code page 437 or 850, Terminal Font)

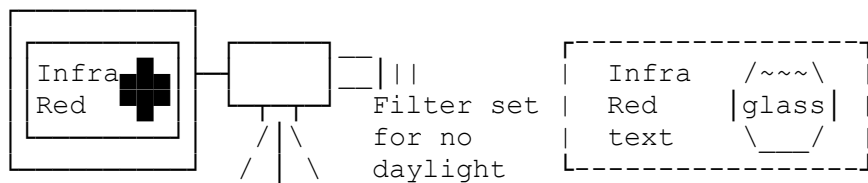

Years ago I did an IR camera trick with an old low light camera that could see IR.

With the above set up the polarize sunglass filters, can let in, or null out visable light. So you either, see the black box, or see through it!

When you see through it, you read the Infra Red text pressed on the inside of the box & a floating back disk.

Then opening the Box you then see a clear glass disk.

Why don't U send an interesting bul?
